Request for Applications
The ASAP Collaborative Research Network
Round One | October 2019

Opportunity
The Aligning Science Across Parkinson’s (ASAP) Initiative invites applications to join the ASAP Collaborative Research Network, an effort to support international, multidisciplinary, multi-institutional research teams to address key knowledge gaps in the basic disease mechanisms that contribute to PD development and progression. Only applications that focus on at least one of the following thematic areas will be considered: Biology of PD-associated Genes and Neuro-immune Interactions.

Goals of the ASAP Collaborative Research Network
We believe that the recent appreciation of PD as a multisystem disorder encompassing motor and non-motor symptoms compels a collaborative and multidisciplinary approach to significantly increase our molecular understanding of disease. We seek to establish an international, multidisciplinary network of collaborating investigators who will address high-priority basic science questions. Further, we seek to:

● Support productive, meaningful collaborations to achieve goals that supersede the expertise or capabilities of any one lab
● Attract diverse talent from relevant fields outside of PD and neurodegeneration, as well as young investigators who will infuse fresh ideas and perspectives to PD research
● Drive intense focus to the selected research themes to accelerate discovery
● Embrace the values of openness and transparency as a means of accelerating outcomes and improving the reproducibility and impact of research findings

We encourage a forward-thinking approach to research that is not constrained by long-held hypotheses and dogma, and that is conducted in an environment of trust. As such, we seek to bring together investigators who are enthusiastic about working transparently in a highly collaborative network -- one that includes field experts working with investigators with no previous record of PD research, who prioritize innovation over safe bets, and who are willing to risk testing unconventional ideas.

Background
About Parkinson’s Disease
PD is the most common neurodegenerative movement disorder that affects the lives of more than six million people around the world. There are currently no treatments that can slow or
stop its relentless progression. As a progressive disorder, PD increasingly robs patients of coordinated movement while also inflicting several non-motor symptoms ranging from cognitive impairment to gastrointestinal issues. Its pathological hallmarks include the irreversible death of dopamine neurons in the substantia nigra pars compacta (SNpc) region of the brain, as well as the aberrant accumulation and aggregation of the protein alpha-synuclein.

Genetic discoveries have expanded our understanding of PD heredity and broadened insights into spontaneous disease. Moreover, key therapeutic targets have been uncovered, which are guiding drug development strategy. Capitalizing on this momentum through strategic investment in discovery science, infrastructure and research tools are essential for continued progress. The opportunity is ripe to expand our limited understanding of basic disease biology, which will bolster future drug discovery efforts as well as sound translational and clinical research. Fundamental questions about contributing molecular and cellular mechanisms, initiating factors and events, genetic risk, selective neuronal death, compensatory pathways, neuro-immune mediators, and much more remain.

About the ASAP Initiative

The ASAP Initiative was created by the Milken Institute Center for Strategic Philanthropy with the support of The Sergey Brin Family Foundation. ASAP is a disease-focused, basic research program that will address key knowledge gaps to accelerate the pace of discovery for PD.

While the PD field has seen significant advancement in recent years, key scientific and systemic barriers continue to impede research progress, namely the lack of scale, multidisciplinary expertise, collaboration, and coordination. ASAP intends to address these gaps to catalyze transformational progress in the field.

Our research roadmap is a tri-part strategy to (1) support multidisciplinary research within three scientific focus areas, (2) generate research-enabling resources for the field, and (3) democratize data to lower the barrier of entry to the field (see Fig 1).

This funding opportunity serves to implement the first part of the overall Initiative strategy with the establishment of the ASAP Collaborative Research Network.

ASAP is partnering with The Michael J. Fox Foundation for Parkinson’s Research (MJFF) to efficiently implement this RFA. The partnership enables ASAP to leverage the Foundation’s grant administration and grantmaking infrastructure to receive applications, administer the review process and make grant awards to projects selected for funding.
Research Focus and Scope

This RFA is aimed at investigations focused solely on underlying disease biology. While research phases (i.e., basic, translational, and clinical) are broad and may overlap, we see the modified definition of basic research used by the National Institute of Neurological Disease and Stroke (NINDS) as the most appropriate for this program; that is,

**Basic Research**: aimed at understanding the structure and function of the nervous system and related physiological systems. Can involve studies performed *in vitro*, in animals, or in humans.

- **Basic/Disease-Focused**: focused on understanding disease mechanisms that contribute to PD.

Given the multidisciplinary remit of ASAP, we have adapted the definition above to capture the nervous system as well as other related/contributing physiological systems.

It is important to note that fundamental/foundational/basic science aimed at elucidating human disease mechanisms can benefit from the use of any model organism. However, it is important that the work is grounded in human biology and disease pathology. For reference, there are a number of PD research tools available, including but not limited to: animal models, human cell lines (including induced pluripotent stem cells [iPSCs]), antibodies, biochemical assays, plasmids, viral vectors, and recombinant protein. While not an exhaustive list, available tools can be searched on these databases:

- **US-based**: MJFF – [Research Tools Catalog](#), iPSCs, biosamples; AlzForum’s PD Research Models Database; NINDS Human Cell and Data Repository; BioSEND Human Biosample Repository
- **EU-based**: European Bank of induced pluripotent Stem Cells (EBiSC); Human Pluripotent Stem Cell Registry (hPSCreg)

About the Scientific Themes

ASAP will focus on three scientific themes: (1) Biology of PD-associated Genes, (2) Neuro-immune Interactions, (3) Circuitry and Brain-body Interactions, with the role of these processes on the progression of PD as an important cross-cutting theme. This RFA will only focus on the first two themes. A later RFA will focus solely on the third theme.

**THEME 1: BIOLOGY OF PD-ASSOCIATED GENES**

Since the first identification of a causal genetic mutation in PD, genetic discoveries have expanded our understanding of PD heredity and broadened insights into spontaneous disease. To date, 90 risk loci have been identified from five genome-wide association studies (GWAS); however, a small minority of genetic mutations are considered causal for PD. **A mechanistic understanding of how these genetic associations contribute to pathobiology is a significant...**
scientific challenge facing the field. This RFA is seeking laboratory assessments of the (patho)-physiological role of these genes and affected signaling pathways.

**THEME 2: NEURO-IMMUNE INTERACTIONS**

Chronic neuroinflammation has long been implicated in PD; however, the underlying molecular mechanisms mediating this process remain unknown. **The opportunity is ripe to elucidate the molecular and cellular contributions of the neuro-immune system to PD pathology.** Data are emerging implicating molecular players such as major histocompatibility complex and immune receptors as well as cellular players such as microglia in the disease process. The field is appreciating that PD is much more than a pure dopaminergic neurodegenerative disease as originally classified. Rather, PD is a multisystem disorder involving the central and peripheral nervous systems, the immune system, and microbiome. This RFA is seeking laboratory assessments of, but not limited to:

- Molecular events that initiate and modify immune responses throughout the disease course
- Molecular function of known PD-related genes in relevant cell types of the immune system (e.g., peripheral immune cells, astrocytes, microglia, etc.), with relevant immune challenges
- Host-microbial interactions and their contribution to the PD prodrome and pathology
- Differential effects of inflammation in the brain and the periphery (e.g., blood-brain barrier, neuronal antigen presentation, the role of adaptive and innate immune cells, etc.)

**CROSS-CUTTING COMPONENT: PROGRESSION**

At the time of clinical PD diagnosis, nearly 60-80% of SNpc neurons have already degenerated. Importantly, non-motor symptoms can precede the onset of overt motor symptoms by up to 20 years, during a period known as the prodrome, raising the possibility that PD may be detectable before SNpc neuronal degeneration. Further, this leads to the broader question of whether intervening during the prodromal period may delay or prevent SNpc neuronal degradation. **The challenge remains in understanding the interplay of heredity, neuro-immune factors, and circuit-level alterations during the prodromal period and how these factors are altered during the progression to overt disease.** This RFA is seeking to understand the molecular determinants of disease progression from earliest triggers (e.g., genetic mutation/variation, immune-targeted perturbagen, and environment) to progressive degeneration and dysfunction.

**Award Overview**

**Funding Available**

Applicants may request funds up to $3 million USD total costs per year per Team to support up to a three-year research plan, for a total of up to $9 million USD in total costs over three years. Total costs are inclusive of a 15% indirect cost rate for all entities. There will be a two-year extension opportunity with commensurate funding for select Teams.
Final funding will be determined based on submission and review of an invited full proposal and budget detailing rationale, key project milestones, and timeline for completion of project goals.

**Eligibility Criteria**

**Institutional Eligibility**

- **Type** – Applications may be submitted by public and private non-profit entities, such as universities, colleges, hospitals, laboratories, units of state and local governments, as well as eligible agencies of the federal government. For-profit entities are also eligible and encouraged to apply.

- **Region** – Applications may be submitted by U.S. and foreign entities.

- **Submitting Institution** – The Coordinating Lead PI must be affiliated with the institution submitting the application and grant funds will be awarded to that institution, which will take responsibility for distributing funds to the institutions of the other members of the collaboration.

**Key Personnel Eligibility**

- **Team Leadership** – Key Personnel for each Team must consist of a minimum of three (3) to a maximum of five (5) PIs. A Coordinating Lead PI must be appointed for each Team, who will be responsible for overall project management and reporting to ASAP/MJFF staff. Team structure and management is discussed in further detail below.

- **Career Stage & Disciplines Represented** – We require the Key Personnel for each Team to consist of at least one (1) early career investigator in the position of Co-I, and for there to be at least two (2) different disciplines represented on each Team.

- **Institutions** – There must be a minimum of two (2), but no more than five (5) participating institutions represented by the Team.
• **Degree** – All Key Personnel must hold a doctorate, such as a PhD, MD, or equivalent degree.

• **Appointment** – The Coordinating Lead PI must have an academic appointment and be in an independent faculty position or equivalent. All other Key Personnel must be in an independent faculty position or equivalent.

• **Time Allocation** – All Key Personnel are expected to allocate a minimum of 25% time and effort to the research project.

### Ineligibility

This RFA will not provide funding to develop or characterize patient cohorts or a stem cell platform. Further, given the basic science remit of this initiative, early drug discovery work is out of scope for this RFA.

Infrastructure support is the second pillar of the ASAP Initiative writ large. There are plans to expand relevant patient cohorts, establish an isogenic iPSC resource expressing key PD-relevant causal/high-risk mutations, as well as deepen genetic analyses by examining PD in ethnically-diverse populations around the globe. We will keep the PD community apprised of the development timeline for these infrastructure projects; therefore, proposals focused on these topics are not appropriate for this RFA.

### Team Structure and Management

Teams are required to be multidisciplinary and multi-institutional. Unlike “Center Grants” that play to the strengths of a single institution, this research network intends to establish teams comprising the best researcher expertise to address key knowledge gaps, regardless of their geographical location or institutional affiliation. Preference will be given to teams that comprise two or more members who have worked together collaboratively with successful integration of diverse talents and approaches. We seek teams who are eager to share ideas and results across the spectrum of the network and who embrace the principles of transparency and open science in publication and public presentations.

Please note, these awards are not intended to be conventional research awards. As such, investigators will be asked to interact regularly with ASAP Initiative-associated staff and advisors to discuss any element of the project. Given the ASAP-MJFF partnership, applicants may hear from ASAP or MJFF staff throughout the project duration.

### DEFINITIONS:

• **Key Personnel** – Each Team should consist of at least three (3), but not more than five (5) Key Personnel members, including: A Coordinating Lead Principal Investigator (PI) and up to four additional Co-Investigators.
• **Coordinating Lead PI.** This person is responsible for the scientific and technical direction of the proposed research project, contractual and financial obligations, and other organizational assurances/certifications. The Coordinating Lead PI must ensure that the Team complies with the terms and conditions of the award, and will be the primary contact person for ASAP Scientific Review as well as MJFF Grants Administration staff. Given the complexity of managing multi-institutional collaborations, it is imperative that the Coordinating Lead PI take primary responsibility for managing the project by providing strong, capable leadership and oversight of the project plan and managing Team communication internally as well as with ASAP-Initiative associated staff. Preference will be given to lead PIs with a history of open science practices and fruitful collaboration with one or more members of the Team.

• **Team Co-Is.** These investigators will lead a component(s)/subproject(s) of the Team’s research project. Please note that at least one of these investigators must be an early career investigator within one (1) to seven (7) years of their first independent appointment. PIs for each Team may be recruited from existing or previous collaborations, or in the case of early career PIs, new talent in areas complementary to those represented by the senior members of the team. Emphasis will be on meaningful collaborations where the senior and junior members of the Team have an equal stake in the planning and goals of the effort and a corresponding share of the credit for discovery.

• **Team Project Manager.** The Coordinating Lead PI is required to budget for a project manager. This person would assist with the day-to-day coordination of all team efforts to consistently maintain a high level of functionality and communication.

**Grant Terms and Policies**

• **Use of Funds** – Funds may be used for scientific and technical personnel, supplies and standard equipment needs directly related to the successful execution of the proposed scope or work. However, funds may not be used for laboratory or facility renovation.

• **Allowable Direct Costs** – ASAP defines direct costs as expenses required to execute a grant that are directly attributable to and can reasonably be allocated to the project. Inclusion of the following costs are permitted as direct costs: personnel salaries, fringe benefits, sub-awards, tuition-related costs (when graduate student is engaged at 100% effort), research supplies, standard equipment needs and maintenance, and travel or related costs for non-ASAP coordinated scientific meetings and conferences. Specialized equipment needs may be considered on an individual basis.

• **Unallowable Costs** – ASAP does not allow the inclusion of any of the following in budgets as direct costs: pass-through indirect costs to sub-awardees, open access publication costs, ASAP-coordinated meetings, entertainment and general office expenses (can be recouped via application of the indirect rate).
Publication Fund – Awardees should submit requests for open access publication costs when a publication is submission-ready. While publication costs should not be included in direct costs, ASAP will cover these costs in full at the appropriate time.

ASAP-coordinated Meetings – ASAP-coordinated meetings will be handled separately and are not to be included in direct costs.

Overhead / Indirect Costs – ASAP defines indirect costs as general overhead and administrative expenses that support the entire operation of the grantee and may be shared across projects (e.g., utilities, IT systems, and general administrative staff such as HR). These expenses would be incurred regardless of whether or not the grant is funded. Recouping indirect costs on a grant is optional. However, ASAP allows grantees to apply a 15% indirect cost rate to their budget's total direct costs.

Please note that these are the maximum rates allowed. A grantee with an actual indirect cost rate lower than the maximum should not apply the maximum rate. We expect that grantees are regularly assessing their overhead costs in relation to their ability to operate effectively and efficiently. Grantees should ensure consistency with their own internal policies regarding indirect cost rates, up to the maximum rate allowed under ASAP policy.

Please note that ASAP/MJFF reserves the right to request substantiation of any grantee's indirect cost rate.

Subawards and Indirect Costs – As this opportunity includes subawards (paid directly by the collaborating institution and treated in the budget as part of that institution’s direct costs), then that collaborating institution may apply its indirect rate to its direct costs minus its subaward costs. In other words, the collaborating institution may not apply its indirect rate to its direct costs inclusive of subaward costs. The subawardee(s), however, may recoup indirect expenses through the application of a 15% indirect rate to its own direct costs. For this reason, it is important that the lump sum for the subaward on the detailed budget consist of direct costs only. ASAP expects collaborating institutions to request detailed budgets from their subawardees and ensure that indirects are not being included in the lump sum of direct costs reported to ASAP.

Carryover Funding – Unused research funds may be carried over to the following year, with approval, and requests for no-cost extensions will be considered.

Open access – All data resulting from the Team’s work will be available to the scientific community at large at the earliest opportunity on preprint servers, online protocol platforms, and in an open access journal format (e.g., Gates Foundation publication policy: https://www.gatesfoundation.org/How-We-Work/General-Information/Open-Access-Policy.)

Publications – All publications related to this funded work must be submitted to a preprint server, such as bioRxiv, before or concurrent to the first submission to a journal. An open access journal format is a requirement of this funding.
opportunity. Experimental protocols should be made publicly available through a protocol sharing service, such as bio-protocol or protocols.io. In addition, early sharing of null and incremental results, within the network and publicly, is encouraged. ASAP requests that scientific publications, preprints, and presentations that result from this award be acknowledged as being supported by this funding.

- **Data and Code Sharing** – All datasets and code, either curated or generated through the project, should be made publicly available and easily accessible online, as early as possible when feasible. This includes metadata, documentation, and intended computational use cases, as appropriate. ASAP and MJFF will work with grantees to identify appropriate data platforms.

- **Reagent Sharing** – ASAP requires that all tools or reagents (a) funded by and (b) that result from awarded projects be made readily available to the community through an accessible community repository, such as the MJFF Tools Program (for model systems, cell lines, vectors), Addgene (for plasmids, DNA reagents, viruses), etc. This requirement applies to cell lines, transgenic models, plasmids/clones, antibodies, and other reagents.

- **Reporting Requirements** – Progress reports are due annually or at other times as deemed necessary by ASAP and MJFF for project evaluation. Progress report forms will be provided by MJFF approximately two months before they are due.

- **Intellectual Property** – ASAP will not retain any rights to funded projects, other than right to publicly discuss data, published results, and intellectual property that result from the research.

**Application Process**

There are three stages for this funding opportunity: (1) pre-proposal, (2) invited full proposal, and (3) finalist virtual interview.

Pre-proposals are due no later than January 8, 2020 by 6pm EST. Following evaluation, teams selected to submit full proposals will be notified by Wednesday, March 4, 2020. Invited full proposals are due no later than Wednesday, April 15th, 2020 by 6pm EST. Finalists will be interviewed virtually by ASAP leadership on June 22-26, 2020. Final funding decisions are anticipated by July 6, 2020 and awardees will be notified.

All applications must be completed and submitted through ASAP online portal at www.parkinsonsroadmap.org/apply. We strongly recommend that applicants familiarize themselves with the online portal in advance of any deadlines. Exceptions will not be made for technical difficulties. For detailed application instructions, please visit the online portal for more information.
As a reminder, ASAP and MJFF are partnering to implement this RFA. As such, applicants may hear from ASAP or MJFF staff with follow-up needs or questions pertaining to their submissions.

Pre-proposal Instructions

A brief pre-proposal is required for funding consideration (no more than three [3] pages). Applicants must use the template available on the online portal. The pre-proposal consists of the following sections:

Project Description
- Project title
- Project summary (100 words maximum)
- Scientific goals and strategy (500 words maximum)
- Relevant research theme (Biology of PD-associated Genetics, Neuro-immune Interactions, or both)
- Statement of impact and alignment with ASAP Initiative goals (100 words maximum)

Team Summary
- List of Team investigators
- Description of each investigator’s role on the project (100 words maximum per investigator)
- Description of the collective expertise and resources that the investigators bring to the Team
- Collaboration history of each investigator including reference to past intra-Team collaboration where relevant (review the pre-proposal template for specific parameters)
- Historical adherence to open science practices (review the pre-proposal template for specific parameters)

Letter of commitment signed from each investigator.

Full Proposal Instructions

Full proposal submissions are by invitation only. A weblink and additional instructions for online submission will be provided to select applicants by Wednesday, March 4, 2020. Full proposals are due no later than Wednesday, April 15, 2020.

Review and Selection Process

There is currently no pre-determined number of research teams that will be a part of the ASAP Collaborative Research Network, and there are no specified number of awards currently set aside. Decision-making will be guided by expert peer review; however, ASAP Executive Leadership and the Scientific Advisory Board reserves the right to make ultimate final funding decisions on any application.
Pre-proposals will be reviewed by ASAP Executive Leadership and ASAP Initiative-associated scientific staff, including but not limited to scientific staff at Milken Institute, The Michael J. Fox Foundation for Parkinson’s Research, Parkinson’s Foundation, and Parkinson’s UK, as well as relevant external advisors. Full proposals will be reviewed by an external Peer Review Committee comprised of multidisciplinary scientists who are familiar with our program goals and have deep expertise in our program’s scientific focus areas, as well as methods proposed in the grant applications. As this RFA intends to bring diverse disciplines together, an equally diverse peer review committee will be essential to this process.

Feedback will not be provided for pre-proposals that are not invited for full application submission. However, feedback will be provided for full proposals that are not selected for funding.

Selection of awardees will be based on the following criteria:

- **Quality** of the proposal, expertise, and capacity of the collaborative group for addressing the proposed project. There should be evidence of synergy and substantive contributions from all assembled members of the research team – i.e., not simply a collection of individual projects.
- **Potential impact** of the research questions being addressed in the application.
- **Focus on basic disease biology.** While the ASAP Initiative is focused on basic science, rather than translational or clinical strategies, the proposed work should have a clear disease context to Parkinson’s disease and include the use of existing human biomaterial where appropriate.
- **Degree** to which the proposed work brings in new ideas to the field and stimulates potential new avenues of investigation.
- **Demonstrated collaborative potential** of the proposed Team as evidenced by co-authorships, past collaborations among at least two (2) members of the Team, as well as relevant contributions to other successful research collaborations in the recent past.
- **Commitment to open science and active research community engagement.** These values may be demonstrated through service on committees and editorial boards, past publication of open access articles, use of preprint servers, protocol repositories, etc.
- **Leadership capacity of the Coordinating Lead PI.** This investigator’s vision, leadership qualities, willingness to collaborate, and demonstrated ability to bring together and lead a multidisciplinary team of experts to a successful conclusion will be a critical factor.

**Confidentiality**

The review process will be performed under confidentiality among all parties involved in proposal evaluation. Funded proposals will be shared across the ASAP Collaborative Research Network, as well as the MJFF network, and lay project summaries will be publicly
communicated on our website. Unfunded proposals will remain confidential. Application materials will not be returned to applicants.

Contact

Inquiries concerning this funding opportunity are encouraged to avoid submission complications. For administrative and programmatic inquiries, please contact grants@parkinsonsroadmap.org. We encourage questions well in advance of the deadline.
